

# Principles of Hypothesis Testing for Public Health

Laura Lee Johnson, Ph.D.  
Statistician  
National Center for Complementary and Alternative Medicine

johnslau@mail.nih.gov  
Fall 2008

---

---

---

---

---

---

---

---

## Questions I Usually Get

- ITT is like generalizing to real life
- I am not a fan of stratification
  - Except by clinic/site
  - Not everyone agrees with me
- OK to adjust for (some) variables
  - Baseline covariates
    - Cannot stratify a continuous variable
      - At least rarely can you do it well
  - Some variables are not ok, or you just upgraded to a fancy model!

---

---

---

---

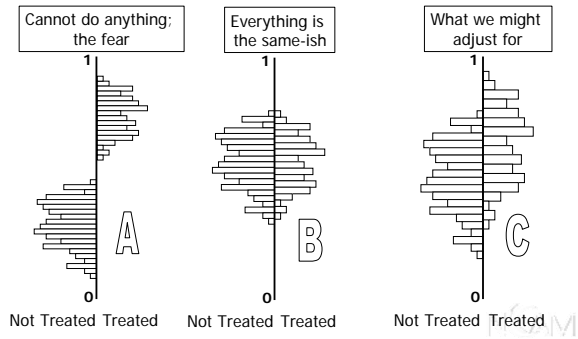

---

---

---

---

## Remember: How Much Overlap Do We Want?

---

---

---

---

---

---

---

---

## Objectives

- Discuss commonly used terms
  - P-value
  - Power
  - Type I and Type II errors
- Present a few commonly used statistical tests for comparing two groups

NICAM

---

---

---

---

---

---

---

---

## Outline

- Estimation and Hypotheses
  - How to Test Hypotheses
  - Confidence Intervals
  - Regression
  - Error
  - Diagnostic Testing
  - Misconceptions

NICAM

---

---

---

---

---

---

---

---

## Estimation and Hypotheses

- Inference
  - How we use Hypothesis Testing
    - Estimation
    - Distributions
    - Hypothesis testing
    - Sides and Tails

NICAM

---

---

---

---

---

---

---

---

## Statistical Inference

- Inferences about a population are made on the basis of results obtained from a sample drawn from that population
- Want to talk about the larger population from which the subjects are drawn, not the particular subjects!

NICAM

---

---

---

---

---

---

---

---

## You Use Hypothesis Testing

- Designing your study
- Reviewing the design of other studies
  - Grant or application review (e.g. NIH study section, IRB)
- Interpreting your study results
- Interpreting other's study results
  - Reviewing a manuscript or journal
  - Interpreting the news

NICAM

---

---

---

---

---

---

---

---

## I Use Hypothesis Testing

- Do all you do
- Analyze the data to find the results
  - Program formulas not presented here in detail
- You can analyze the data, too, but be careful

NICAM

---

---

---

---

---

---

---

---

## Analysis Follows Design

Questions → Hypotheses →  
Experimental Design → Samples →  
Data → Analyses → Conclusions

NICAM

---

---

---

---

---

---

---

---

## What Do We Test

- Effect or *Difference* we are interested in
  - Difference in Means or Proportions
  - Odds Ratio (OR)
  - Relative Risk (RR)
  - Correlation Coefficient
- Clinically important difference
  - Smallest difference considered biologically or clinically relevant
- Medicine: usually 2 group comparison of population means

NICAM

---

---

---

---

---

---

---

---

## Estimation and Hypotheses

- ✓ Inference
- ✓ How we use Hypothesis Testing
- Estimation
  - Distributions
  - Hypothesis testing
  - Sides and Tails

NICAM

---

---

---

---

---

---

---

---

## Estimation: From the Sample

- Point estimation
  - Mean
  - Median
  - Change in mean/median
- Interval estimation
  - Variation (e.g. range,  $\sigma^2$ ,  $\sigma$ ,  $\sigma/\sqrt{n}$ )
  - 95% Confidence interval

NICAM

---

---

---

---

---

---

---

---

## Pictures, Not Numbers

- Scatter plots
- Bar plots (use a table)
- Histograms
- Box plots
  
- Not Estimation
  - See the data and check assumptions

NICAM

---

---

---

---

---

---

---

---

## Graphs and Tables

- A picture is worth a thousand t-tests
- Vertical (Y) axis can be misleading

NICAM

---

---

---

---

---

---

---

---

## Like the Washington Post Weather, Though

---

---

---

---

---

---

---

---

## Estimation and Hypotheses

- ✓ Inference
- ✓ How we use Hypothesis Testing
- ✓ Estimation
- Distributions
  - Hypothesis testing
  - Sides and Tails

---

---

---

---

---

---

---

---

## Distributions

- Parametric tests are based on distributions
  - Normal Distribution (standard normal, bell curve, Z distribution)
- Non-parametric tests still have assumptions, but not based on distributions

---

---

---

---

---

---

---

---

## 2 of the Continuous Distributions

- Normal/Gaussian distribution:  $N(\mu, \sigma^2)$ 
  - $\mu$  = mean,  $\sigma^2$  = variance
  - Z or standard normal =  $N(0,1)$
- t distribution:  $t_\omega$ 
  - $\omega$  = degrees of freedom (df)
    - Usually a function of sample size
  - Mean =  $\bar{x}$  (sample mean)
  - Variance =  $s^2$  (sample variance)

NICAM

---

---

---

---

---

---

---

---

## Binary Distribution

- Binomial distribution:  $B(n, p)$ 
  - Sample size =  $n$
  - Proportion 'yes' =  $p$
  - Mean =  $np$
  - Variance =  $np(1-p)$
- Can do exact or use Normal

NICAM

---

---

---

---

---

---

---

---

## Many More Distributions

- Not going to cover
- Poisson
- Log normal
- Gamma
- Beta
- Weibull
- Many more

NICAM

---

---

---

---

---

---

---

---

## Estimation and Hypotheses

- ✓ Inference
- ✓ How we use Hypothesis Testing
- ✓ Estimation
- ✓ Distributions
- Hypothesis Testing
- Sides and Tails

NICAM

---

---

---

---

---

---

---

---

## Hypothesis Testing

- Null hypothesis ( $H_0$ )
- Alternative hypothesis ( $H_1$  or  $H_a$ )

NICAM

---

---

---

---

---

---

---

---

## Null Hypothesis

- Usually that there is no effect
  - Mean = 0
  - OR = 1
  - RR = 1
  - Correlation Coefficient = 0
- Generally fixed value: mean = 4
- If an equivalence trial, look at NEJM paper or other specific resources

NICAM

---

---

---

---

---

---

---

---

## Alternative Hypothesis

- Contradicts the null
- There *is* an effect
- What you want to prove
- If equivalence trial, special way to do this

NICAM

---

---

---

---

---

---

---

---

## Example Hypotheses

- $H_0: \mu_1 = \mu_2$
- $H_A: \mu_1 \neq \mu_2$ 
  - Two-sided test
- $H_A: \mu_1 > \mu_2$ 
  - One-sided test

NICAM

---

---

---

---

---

---

---

---

## 1 vs. 2 Sided Tests

- Two-sided test
  - No *a priori* reason 1 group should have stronger effect
  - Used for most tests
- One-sided test
  - Specific interest in only one direction
  - Not scientifically relevant/interesting if reverse situation true

NICAM

---

---

---

---

---

---

---

---

### Use a 2-Sided Test

- Almost always
- If you use a one-sided test
  - Explain yourself
  - Penalize yourself on the alpha
    - 0.05 2-sided test becomes a 0.025 1-sided test

---

---

---

---

---

---

---

---

### Take Home: Hypothesis Testing

- Null hypothesis ( $H_0$ )
- Alternative hypothesis ( $H_1$  or  $H_a$ )
- What do you expect to happen?
- Never “accept” anything
  - Reject the null hypothesis
  - Fail to reject the null hypothesis

---

---

---

---

---

---

---

---

### Outline

- ✓ Estimation and Hypotheses
- How to Test Hypotheses
- Confidence Intervals
- Regression
- Error
- Diagnostic Testing
- Misconceptions

---

---

---

---

---

---

---

---

## Experiment

- Develop hypotheses
- Collect sample/Conduct experiment
- Calculate test statistic
- Compare test statistic with what is expected when  $H_0$  is true

NCAM

---

---

---

---

---

---

---

---

## Information at Hand

- 1 or 2 sample test?
- Outcome variable
  - Binary, Categorical, Ordered, Continuous, Survival
- Population
- Numbers (e.g. mean, standard deviation)

NCAM

---

---

---

---

---

---

---

---

## Example:

### Hypertension/Cholesterol

- Mean cholesterol hypertensive men
- Mean cholesterol in male general (normotensive) population (20-74 years old)
- In the 20-74 year old male population the mean serum cholesterol is 211 mg/ml with a standard deviation of 46 mg/ml

NCAM

---

---

---

---

---

---

---

---

**One Sample:  
Cholesterol Sample Data**

- Have data on 25 hypertensive men
- Mean serum cholesterol level is 220mg/ml ( $\bar{x} = 220$  mg/ml)
  - Point estimate of the mean
- Sample standard deviation:  $s = 38.6$  mg/ml
  - Point estimate of the variance =  $s^2$

NICAM

---

---

---

---

---

---

---

---

**Compare Sample to Population**

- Is 25 enough?
  - Next lecture we will discuss
- What difference in cholesterol is clinically or biologically meaningful?
- Have an available sample and want to know if hypertensives are different than general population

NICAM

---

---

---

---

---

---

---

---

**Situation**

- May be you are reading another person's work
- May be already collected data
  
- If you were designing up front you would calculate the sample size
  - But for now, we have 25 people

NICAM

---

---

---

---

---

---

---

---

### Cholesterol Hypotheses

- $H_0: \mu_1 = \mu_2$
- $H_0: \mu = 211 \text{ mg/ml}$ 
  - $\mu$  = POPULATION mean serum cholesterol for male hypertensives
  - Mean cholesterol for hypertensive men = mean for general male population
- $H_A: \mu_1 \neq \mu_2$
- $H_A: \mu \neq 211 \text{ mg/ml}$

NICAM

---

---

---

---

---

---

---

---

### Cholesterol Sample Data

- Population information (general)
  - $\mu = 211 \text{ mg/ml}$
  - $\sigma = 46 \text{ mg/ml}$  ( $\sigma^2 = 2116$ )
- Sample information (hypertensives)
  - $\bar{X} = 220 \text{ mg/ml}$
  - $s = 38.6 \text{ mg/ml}$  ( $s^2 = 1489.96$ )
  - $N = 25$

NICAM

---

---

---

---

---

---

---

---

### Experiment

- ✓ Develop hypotheses
- ✓ Collect sample/Conduct experiment
- Calculate test statistic
- Compare test statistic with what is expected when  $H_0$  is true

NICAM

---

---

---

---

---

---

---

---

## Test Statistic

- Basic test statistic for a mean

$$\text{test statistic} = \frac{\text{point estimate of } \mu - \text{target value of } \mu}{\frac{\sigma_{\text{point estimate of } \mu}}{\sqrt{n}}}$$

- $\sigma$  = standard deviation (sometimes use  $\sigma/\sqrt{n}$ )
- For 2-sided test: Reject  $H_0$  when the test statistic is in the upper or lower  $100 \cdot \alpha / 2\%$  of the reference distribution
- What is  $\alpha$ ?

NICAM

---

---

---

---

---

---

---

---

## Vocabulary

- Types of errors
  - Type I ( $\alpha$ ) (false positives)
  - Type II ( $\beta$ ) (false negatives)
- Related words
  - Significance Level:  $\alpha$  level
  - Power:  $1 - \beta$

NICAM

---

---

---

---

---

---

---

---

## Unknown Truth and the Data

Truth \ Data	$H_0$ Correct	$H_A$ Correct
Decide $H_0$ "fail to reject $H_0$ "	$1 - \alpha$ True Negative	$\beta$ False Negative
Decide $H_A$ "reject $H_0$ "	$\alpha$ False Positive	$1 - \beta$ True Positive

$\alpha$  = significance level

$1 - \beta$  = power

NICAM

---

---

---

---

---

---

---

---

## Type I Error

- $\alpha = P(\text{reject } H_0 \mid H_0 \text{ true})$
- Probability reject the null hypothesis given the null is true
- False positive
- Probability reject that hypertensives'  $\mu=211\text{mg/ml}$  when in truth the mean cholesterol for hypertensives is 211

NICAM

---

---

---

---

---

---

---

---

## Type II Error (or, 1- Power)

- $\beta = P(\text{do not reject } H_0 \mid H_1 \text{ true})$
- False Negative
- Probability we NOT reject that male hypertensives' cholesterol is that of the general population when in *truth* the mean cholesterol for hypertensives *is different* than the general male population

NICAM

---

---

---

---

---

---

---

---

## Power

- Power =  $1-\beta = P(\text{reject } H_0 \mid H_1 \text{ true})$
- Everyone wants high power, and therefore low Type II error

NICAM

---

---

---

---

---

---

---

---

### Cholesterol Sample Data

- $N = 25$
- $\bar{X} = 220$  mg/ml
- $\mu = 211$  mg/ml
- $s = 38.6$  mg/ml ( $s^2 = 1489.96$ )
- $\sigma = 46$  mg/ml ( $\sigma^2 = 2116$ )
- $\alpha = 0.05$
- Power? Next lecture!

NICAM

---

---

---

---

---

---

---

---

### Z Test Statistic and N(0,1)

- Want to test continuous outcome
- Known variance
- Under  $H_0$   $\frac{\bar{X} - \mu_0}{\sigma/\sqrt{n}} \sim N(0,1)$
- Therefore,  
Reject  $H_0$  if  $\left| \frac{\bar{X} - \mu_0}{\sigma/\sqrt{n}} \right| > 1.96$  (gives a 2-sided  $\alpha=0.05$  test)  
Reject  $H_0$  if  $\bar{X} > \mu_0 + 1.96 \frac{\sigma}{\sqrt{n}}$  or  $\bar{X} < \mu_0 - 1.96 \frac{\sigma}{\sqrt{n}}$

NICAM

---

---

---

---

---

---

---

---

### Experiment

- ✓ Develop hypotheses
- ✓ Collect sample/Conduct experiment
- ✓ Calculate test statistic
- Compare test statistic with what is expected when  $H_0$  is true
  - Reference distribution
  - Assumptions about distribution of outcome variable

NICAM

---

---

---

---

---

---

---

---

### Z or Standard Normal Distribution

---

---

---

---

---

---

---

---

### Z or Standard Normal Distribution

---

---

---

---

---

---

---

---

### Z or Standard Normal Distribution

---

---

---

---

---

---

---

---

## How to test?

- Rejection interval
  - Like a confidence interval but centered on the null mean
- Z test or Critical Value
  - N(0,1) distribution and alpha
- t test or Critical Value
  - t distribution and alpha
- P-value
- Confidence interval

NICAM

---

---

---

---

---

---

---

---

## General Formula (1-α)% Rejection Region for Mean Point Estimate

$$\left( \mu - \frac{Z_{1-\alpha/2}\sigma}{\sqrt{n}}, \mu + \frac{Z_{1-\alpha/2}\sigma}{\sqrt{n}} \right)$$

- Note that  $+Z_{(\alpha/2)} = -Z_{(1-\alpha/2)}$
- 90% CI : Z = 1.645
- 95% CI : Z = 1.96
- 99% CI : Z = 2.58

NICAM

---

---

---

---

---

---

---

---

## Cholesterol Rejection Interval Using $H_0$ Population Information

NICAM

---

---

---

---

---

---

---

---

### Cholesterol Rejection Interval Using $H_0$ Sample Information

---

---

---

---

---

---

---

---

### Side Note on $t$ vs. $Z$

- If  $s = \sigma$  then the  $t$  value will be larger than the  $Z$  value
- BUT, here our sample standard deviation (38.6) was quite a bit smaller than the population sd (46)
  - HERE intervals using  $t$  look smaller than  $Z$  intervals BUT
  - Because of sd, not distribution

---

---

---

---

---

---

---

---

### How to test?

- ✓ Rejection interval
  - Like a confidence interval but centered on the null mean
- $Z$  test or Critical Value
  - $N(0,1)$  distribution and alpha
- $t$  test or Critical Value
  - $t$  distribution and alpha
- P-value
- Confidence interval

---

---

---

---

---

---

---

---

### Z-test: Do Not Reject $H_0$

$$|Z| = \left| \frac{\bar{X} - \mu_0}{\sigma/\sqrt{n}} \right| = \left| \frac{220 - 211}{46/\sqrt{25}} \right| = 0.98 < 1.96$$

NICAM

---

---

---

---

---

---

---

---

### Z or Standard Normal Distribution

NICAM

---

---

---

---

---

---

---

---

### Determining Statistical Significance: Critical Value Method

- Compute the test statistic Z (0.98)
- Compare to the critical value
  - Standard Normal value at  $\alpha$ -level (1.96)
- If  $|\text{test statistic}| > \text{critical value}$ 
  - Reject  $H_0$
  - Results are *statistically significant*
- If  $|\text{test statistic}| < \text{critical value}$ 
  - Do not reject  $H_0$
  - Results are *not statistically significant*

NICAM

---

---

---

---

---

---

---

---

### T-Test Statistic

- Want to test continuous outcome
- Unknown variance (s, not  $\sigma$ )
- Under  $H_0$   $\frac{\bar{X} - \mu_0}{s/\sqrt{n}} \sim t_{(n-1)}$
- Critical values: statistics books or computer
- t-distribution approximately normal for degrees of freedom (df) >30

NICAM

---

---

---

---

---

---

---

---

### Cholesterol: t-statistic

- Using data
- For  $\alpha = 0.05$ , two-sided test from t(24) distribution the critical value = 2.064
- $|T| = 1.17 < 2.064$
- The difference is not statistically significant at the  $\alpha = 0.05$  level
- Fail to reject  $H_0$

NICAM

---

---

---

---

---

---

---

---

### Almost all 'Critical Value' Tests: Exact Same Idea

- Paired tests
- 2-sample tests
- Continuous data
- Binary data
- See appendix at end of slides

NICAM

---

---

---

---

---

---

---

---

## How to test?

- ✓ Rejection interval
  - Like a confidence interval but centered on the null mean
- ✓ Z test or Critical Value
  - $N(0,1)$  distribution and alpha
- ✓ t test or Critical Value
  - t distribution and alpha
- P-value
  - Confidence interval

NICAM

---

---

---

---

---

---

---

---

## P-value

- Smallest  $\alpha$  the observed sample would reject  $H_0$
- Given  $H_0$  is true, probability of obtaining a result as extreme or more extreme than the actual sample
- **MUST** be based on a model
  - Normal, t, binomial, etc.

NICAM

---

---

---

---

---

---

---

---

## Cholesterol Example

- P-value for two sided test
- $\mu = 220$  mg/ml,  $\sigma = 46$  mg/ml
- $n = 25$
- $H_0: \mu = 211$  mg/ml
- $H_A: \mu \neq 211$  mg/ml

NICAM

---

---

---

---

---

---

---

---

### Determining Statistical Significance: P-Value Method

- Compute the exact p-value (0.33)
- Compare to the predetermined  $\alpha$ -level (0.05)
- If p-value < predetermined  $\alpha$ -level
  - Reject  $H_0$
  - Results are *statistically significant*
- If p-value > predetermined  $\alpha$ -level
  - Do not reject  $H_0$
  - Results are *not statistically significant*

NICAM

---

---

---

---

---

---

---

---

### P-value Interpretation Reminders

- Measure of the strength of evidence in the data that the null is not true
- A random variable whose value lies between 0 and 1
- NOT the probability that the null hypothesis is true.

NICAM

---

---

---

---

---

---

---

---

### How to test?

- ✓ Rejection interval
  - Like a confidence interval but centered on the null mean
- ✓ Z test or Critical Value
  - $N(0,1)$  distribution and alpha
- ✓ t test or Critical Value
  - t distribution and alpha
- ✓ P-value
- Confidence interval

NICAM

---

---

---

---

---

---

---

---

## Outline

- ✓ Estimation and Hypotheses
- ✓ How to Test Hypotheses
- Confidence Intervals
  - Regression
  - Error
  - Diagnostic Testing
  - Misconceptions

NKAM

---

---

---

---

---

---

---

---

## General Formula (1- $\alpha$ )% CI for $\mu$

$$\left( \bar{X} - \frac{Z_{1-\alpha/2}\sigma}{\sqrt{n}}, \bar{X} + \frac{Z_{1-\alpha/2}\sigma}{\sqrt{n}} \right)$$

- Construct an interval around the point estimate
- Look to see if the population/null mean is inside

NKAM

---

---

---

---

---

---

---

---

## Cholesterol Confidence Interval Using Population Variance ( Z )

NKAM

---

---

---

---

---

---

---

---

### CI for the Mean, Unknown Variance

- Pretty common
- Uses the t distribution
- Degrees of freedom

$$\left( \bar{X} - \frac{t_{n-1, \alpha/2} s}{\sqrt{n}}, \bar{X} + \frac{t_{n-1, \alpha/2} s}{\sqrt{n}} \right)$$

$$= \left( 220 - \frac{2.064 * 38.6}{\sqrt{25}}, 220 + \frac{2.064 * 38.6}{\sqrt{25}} \right)$$

$$= (204.06, 235.93)$$

NICAM

---

---

---

---

---

---

---

---

### Cholesterol Confidence Interval Using Sample Data ( t )

NICAM

---

---

---

---

---

---

---

---

### But I Have All Zeros! Calculate 95% upper bound

- Known # of trials without an event (2.11 van Belle 2002, Louis 1981)
- Given no observed events in  $n$  trials, 95% upper bound on rate of occurrence is  $3 / (n + 1)$ 
  - No fatal outcomes in 20 operations
  - 95% upper bound on rate of occurrence =  $3 / (20 + 1) = 0.143$ , so the rate of occurrence of fatalities could be as high as 14.3%

NICAM

---

---

---

---

---

---

---

---

### Hypothesis Testing and Confidence Intervals

- Hypothesis testing focuses on where the sample mean is located
- Confidence intervals focus on plausible values for the population mean

NICAM

---

---

---

---

---

---

---

---

### CI Interpretation

- Cannot determine if a particular interval does/does not contain true mean
- Can say in the long run
  - Take many samples
  - Same sample size
  - From the same population
  - 95% of similarly constructed confidence intervals will contain true mean

NICAM

---

---

---

---

---

---

---

---

### Interpret a 95% Confidence Interval (CI) for the population mean, $\mu$

- “If we were to find many such intervals, each from a different random sample but in exactly the same fashion, then, in the long run, about 95% of our intervals would include the population mean,  $\mu$ , and 5% would not.”

NICAM

---

---

---

---

---

---

---

---

### Do NOT interpret a 95% CI...

- “There is a 95% probability that the true mean lies between the two confidence values we obtained from a particular sample”
- “We can say that we are 95% confident that the true mean does lie between these two values.”
- Overlapping CIs do NOT imply non-significance

NICAM

---

---

---

---

---

---

---

---

### Take Home: Hypothesis Testing

- Many ways to test
  - Rejection interval
  - Z test, t test, or Critical Value
  - P-value
  - Confidence interval
- For this, all ways will agree
  - If not: math wrong, rounding errors
- Make sure interpret correctly

NICAM

---

---

---

---

---

---

---

---

### Take Home Hypothesis Testing

- How to turn questions into hypotheses
- Failing to reject the null hypothesis DOES NOT mean that the null is true
- Every test has assumptions
  - A statistician can check all the assumptions
  - If the data does not meet the assumptions there are non-parametric versions of tests (see text)

NICAM

---

---

---

---

---

---

---

---

### Take Home: CI

- Meaning/interpretation of the CI
- How to compute a CI for the true mean when variance is known (normal model)
- How to compute a CI for the true mean when the variance is NOT known (t distribution)

NICAM

---

---

---

---

---

---

---

---

### Take Home: Vocabulary

- Null Hypothesis:  $H_0$
- Alternative Hypothesis:  $H_1$  or  $H_a$  or  $H_A$
- Significance Level:  $\alpha$  level
- Acceptance/Rejection Region
- Statistically Significant
- Test Statistic
- Critical Value
- P-value, Confidence Interval

NICAM

---

---

---

---

---

---

---

---

### Outline

---

---

---

## Regression

- Continuous outcome
  - Linear
- Binary outcome
  - Logistic
- Many other types

NICAM

---

---

---

---

---

---

---

---

## Linear regression

- Model for simple linear regression
  - $Y_i = \beta_0 + \beta_1 X_{1i} + \varepsilon_i$
  - $\beta_0$  = intercept
  - $\beta_1$  = slope
- Assumptions
  - Observations are independent
  - Normally distributed with constant variance
- Hypothesis testing
  - $H_0: \beta_1 = 0$  vs.  $H_A: \beta_1 \neq 0$

NICAM

---

---

---

---

---

---

---

---

## In Order of Importance

1. Independence
2. Equal variance
3. Normality

(for ANOVA and linear regression)

NICAM

---

---

---

---

---

---

---

---

### More Than One Covariate

- $Y_i = \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \beta_3 x_{3i} + \varepsilon_i$
- $SBP =$   
 $\beta_0 + \beta_1 Drug + \beta_2 Male + \beta_3 Age$
- $\beta_1$ 
  - Association between Drug and SBP
  - Average difference in SBP between the Drug and Control groups, given sex and age

NICAM

---

---

---

---

---

---

---

---

### Testing?

- Each  $\beta$  has a  $p$ -value associated with it
- Each model will have an F-test
- Other methods to determine fit
  - Residuals
- See a statistician and/or take a biostatistics class. Or 3.

NICAM

---

---

---

---

---

---

---

---

### Repeated Measures (3 or more time points)

- Do NOT use repeated measures AN(C)OVA
  - Assumptions quite stringent
- Talk to a statistician
  - Mixed model
  - Generalized estimating equations
  - Other

NICAM

---

---

---

---

---

---

---

---

**An Aside: Correlation**

- Range: -1 to 1
- Test is correlation is  $\neq 0$
- With  $N=1000$ , easy to have highly significant ( $p < 0.001$ ) correlation = 0.05
  - Statistically significant that is
  - No where CLOSE to meaningfully different from 0
- Partial Correlation Coefficient

NICAM

---

---

---

---

---

---

---

---

**Do Not Use Correlation.  
Use Regression**

- Some fields: Correlation still popular
  - Partial regression coefficients
- High correlation is  $> 0.8$  (in absolute value). Maybe 0.7
- Never believe a  $p$ -value from a correlation test
- Regression coefficients are more meaningful

NICAM

---

---

---

---

---

---

---

---

**Analysis Follows Design**

Questions → Hypotheses →  
Experimental Design → Samples →  
Data → Analyses → Conclusions

NICAM

---

---

---

---

---

---

---

---

## Outline

- ✓ Estimation and Hypotheses
- ✓ How to Test Hypotheses
- ✓ Confidence Intervals
- ✓ Regression
- Error
  - Diagnostic Testing
  - Misconceptions

NICAM

---

---

---

---

---

---

---

---

## Is $\alpha$ or $\beta$ more important ?

- Depends on the question
- Most will say protect against Type I error
- Need to think about individual and population health implications and costs

NICAM

---

---

---

---

---

---

---

---

## Microarray / Gene Chip

- False negative (Type II error)
  - Miss what could be important
  - Are these samples going to be looked at again?
- False positive (Type I error)
  - Waste resources following dead ends

NICAM

---

---

---

---

---

---

---

---

## HIV Screening

- False positive
  - Needless worry
  - Stigma
- False negative
  - Thinks everything is ok
  - Continues to spread disease
- For cholesterol example?

NICAM

---

---

---

---

---

---

---

---

## What do you need to think about?

- Is it worse to treat those who truly are not ill or to not treat those who are ill?
- That answer will help guide you as to what amount of error you are willing to tolerate in your trial design

NICAM

---

---

---

---

---

---

---

---

## Outline

- ✓ Estimation and Hypotheses
- ✓ How to Test Hypotheses
- ✓ Confidence Intervals
- ✓ Regression
- ✓ Error
- Diagnostic Testing
- Misconceptions

NICAM

---

---

---

---

---

---

---

---

## Little Diagnostic Testing Lingo

- False Positive/False Negative ( $\alpha$ ,  $\beta$ )
- Positive Predictive Value (PPV)
  - Probability diseased given POSITIVE test result
- Negative Predictive Value (NPV)
  - Probability NOT diseased given NEGATIVE test result
- Predictive values depend on disease prevalence

NICAM

---

---

---

---

---

---

---

---

## Sensitivity, Specificity

- Sensitivity: how good is a test at correctly IDing people who have disease
  - Can be 100% if you say everyone is ill (all have positive result)
  - Useless test with bad Specificity
- Specificity: how good is the test at correctly IDing people who are well

NICAM

---

---

---

---

---

---

---

---

## Example: Western vs. ELISA

- 1 million people
- ELISA Sensitivity = 99.9%
- ELISA Specificity = 99.9%
- 1% prevalence of infection
  - 10,000 positive by Western (gold standard)
  - 9990 true positives (TP) by ELISA
  - 10 false negatives (FN) by ELISA

NICAM

---

---

---

---

---

---

---

---

### 1% Prevalence

- 990,000 not infected
  - 989,010 True Negatives (TN)
  - 990 False Positives (FP)
- Without confirmatory test
  - Tell 990 or ~0.1% of the population they are infected when in reality they are not
  - PPV = 91%, NPV = 99.999%

---

---

---

---

---

---

---

---

### 1% Prevalence

- 10980 total test positive by ELISA
  - 9990 true positive
  - 990 false positive
- $9990/10980 = \text{probability diseased GIVEN positive by ELISA} = \text{PPV} = 0.91 = 91\%$
- 989,020 total test negatives by ELISA
  - 989,010 true negatives
  - 10 false negatives
- $989010/989020 = \text{NPV} = 99.999\%$

---

---

---

---

---

---

---

---

### 0.1% Prevalence

- 1,000 infected – ELISA picks up 999
  - 1 FN
- 999,000 not infected
  - 989,001 True Negatives (TN)
  - 999 False Positives (FP)
- Positive predictive value = 50%
- Negative predictive value = 99.999%

---

---

---

---

---

---

---

---

**10% Prevalence**

- **99% PPV**
- **99.99% NPV**

NICAM

---

---

---

---

---

---

---

---

**Prevalence Matters**  
(Population You Sample to Estimate  
Prevalence, too)

- Numbers look “good” with high prevalence
  - Testing at STD clinic in high risk populations
- Low prevalence means even very high sensitivity and specificity will result in middling PPV
- Calculate PPV and NPV for 0.01% prevalence found in female blood donors

NICAM

---

---

---

---

---

---

---

---

**Prevalence Matters**

- PPV and NPV tend to come from good cohort data
- Can estimate PPV/NPV from case control studies but the formulas are hard and you need to be **REALLY** sure about the prevalence
  - Triple sure

NICAM

---

---

---

---

---

---

---

---

## A Little More Testing

NICAM

---

---

---

---

---

---

---

---

## High OR

### Does Not a Good Test Make

- Diagnostic tests need separation
- ROC curves
  - Not logistic regression with high OR
- Strong association between 2 variables does not mean good prediction of separation

NICAM

---

---

---

---

---

---

---

---

## What do you need to think about?

- How good does the test need to be?
  - 96% sensitivity and 10% specificity?
  - 66% AUC? (What is that?)
- Guide you as to what amount of differentiation, levels of sensitivity, specificity, PPV and NPV you are willing to tolerate in your trial design

NICAM

---

---

---

---

---

---

---

---

## Outline

- ✓ Estimation and Hypotheses
- ✓ How to Test Hypotheses
- ✓ Confidence Intervals
- ✓ Regression
- ✓ Error
- ✓ Diagnostic Testing
- Misconceptions

NICAM

---

---

---

---

---

---

---

---

## Avoid Common Mistakes: Hypothesis Testing

- If you have paired data, use a paired test
  - If you don't then you can lose power
- If you do NOT have paired data, do NOT use a paired test
  - You can have the wrong inference

NICAM

---

---

---

---

---

---

---

---

## Avoid Common Mistakes: Hypothesis Testing

- These tests have assumptions of independence
  - Taking multiple samples per subject ? Statistician MUST know
  - Different statistical analyses MUST be used and they can be difficult!
- Distribution of the observations
  - Histogram of the observations
  - Highly skewed data - t test - incorrect results

NICAM

---

---

---

---

---

---

---

---

### Avoid Common Mistakes: Hypothesis Testing

- Assume equal variances and the variances are not equal
  - Did not show variance test
  - Not that good of a test
  - ALWAYS graph your data first to assess symmetry and variance
- Not talking to a statistician

NIQAM

---

---

---

---

---

---

---

---

### Estimates and P-Values

- Study 1:  $25 \pm 9$ 
  - Stat sig at the 1% level
- Study 2:  $10 \pm 9$ 
  - Not statistically significant (ns)
- 25 vs. 10 wow a big difference between these studies!
  - Um, no.  $15 \pm 12.7$

NIQAM

---

---

---

---

---

---

---

---

### Comparing A to B

- Appropriate
  - Statistical properties of A-B
  - Statistical properties of A/B
- NOT Appropriate
  - Statistical properties of A
  - Statistical properties of B
  - Look they are different!

NIQAM

---

---

---

---

---

---

---

---

### Not a big difference? 15?!?

- Distribution of the difference
  - $15 \pm 12.7$
  - Not statistically significant
  - Standard deviations! Important.
- Study 3 has much larger sample size!
  - $2.5 \pm 0.9$

NICAM

---

---

---

---

---

---

---

---

### 3 Studies. 3 Answers, Maybe

- Study # 3 is statistically significant
- Difference between study 3 and the other studies
  - Statistical
  - Different magnitudes
- Does study 3 replicate study 1?
- Is it all sample size?

NICAM

---

---

---

---

---

---

---

---

### Misconceptions

- P-value = inferential tool
  - Helps demonstrate that population means in two groups are not equal
- Smaller p-value → larger effect
  - Effect size is determined by the difference in the sample mean or proportion between 2 groups

NICAM

---

---

---

---

---

---

---

---

**Misconceptions**

- A small p-value means the difference is statistically significant, not that the difference is clinically significant
  - A large sample size can help get a small p-value
- Failing to reject  $H_0$ 
  - There is not enough evidence to reject  $H_0$
  - Does NOT mean  $H_0$  is true

NICAM

---

---

---

---

---

---

---

---

**Analysis Follows Design**

Questions → Hypotheses →  
Experimental Design → Samples →  
Data → Analyses → Conclusions

NICAM

---

---

---

---

---

---

---

---

**Questions?**

NICAM

---

---

---

---

---

---

---

---

## Appendix

- Formulas for Critical Values
- Layouts for how to choose a test

NICAM

---

---

---

---

---

---

---

---

## Do Not Reject $H_0$

$$220 = \bar{X} > \mu_0 + 1.96 \frac{\sigma}{\sqrt{n}} = 211 + 1.96 * \frac{46}{\sqrt{25}} = 228.03 \text{ NO!}$$
$$220 = \bar{X} < \mu_0 - 1.96 \frac{\sigma}{\sqrt{n}} = 211 - 1.96 * \frac{46}{\sqrt{25}} = 192.97 \text{ NO!}$$

NICAM

---

---

---

---

---

---

---

---

## Paired Tests: Difference Two Continuous Outcomes

- Exact same idea
- Known variance: Z test statistic
- Unknown variance: t test statistic
- $H_0: \mu_d = 0$  vs.  $H_A: \mu_d \neq 0$
- Paired Z-test or Paired t-test

$$Z = \frac{\bar{d}}{\sigma/\sqrt{n}} \text{ or } T = \frac{\bar{d}}{s/\sqrt{n}}$$

NICAM

---

---

---

---

---

---

---

---

## 2 Samples: Same Variance

+ Sample Size Calculation Basis

- Unpaired - Same idea as paired
- Known variance: Z test statistic
- Unknown variance: t test statistic
- $H_0: \mu_1 = \mu_2$  vs.  $H_A: \mu_1 \neq \mu_2$ 
  - $H_0: \mu_1 - \mu_2 = 0$  vs.  $H_A: \mu_1 - \mu_2 \neq 0$
- Assume common variance

$$Z = \frac{\bar{x} - \bar{y}}{\sigma\sqrt{1/n+1/m}} \text{ or } T = \frac{\bar{x} - \bar{y}}{s\sqrt{1/n+1/m}}$$

NICAM

---

---

---

---

---

---

---

---

## 2 Sample Unpaired Tests: 2 Different Variances

- Same idea
- Known variance: Z test statistic
- Unknown variance: t test statistic
- $H_0: \mu_1 = \mu_2$  vs.  $H_A: \mu_1 \neq \mu_2$
- $H_0: \mu_1 - \mu_2 = 0$  vs.  $H_A: \mu_1 - \mu_2 \neq 0$

$$Z = \frac{\bar{x} - \bar{y}}{\sqrt{\sigma_1^2/n + \sigma_2^2/m}} \text{ or } T = \frac{\bar{x} - \bar{y}}{\sqrt{s_1^2/n + s_2^2/m}}$$

NICAM

---

---

---

---

---

---

---

---

## One Sample Binary Outcomes

- Exact same idea
- For large samples
  - Use Z test statistic
  - Set up in terms of proportions, not means

$$Z = \frac{\hat{p} - p_0}{\sqrt{p_0(1-p_0)/n}}$$

NICAM

---

---

---

---

---

---

---

---

## Two Population Proportions

- Exact same idea
- For large samples use Z test statistic

$$Z = \frac{\hat{p}_1 - \hat{p}_2}{\sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n} + \frac{\hat{p}_2(1-\hat{p}_2)}{m}}}$$

NICAM

---

---

---

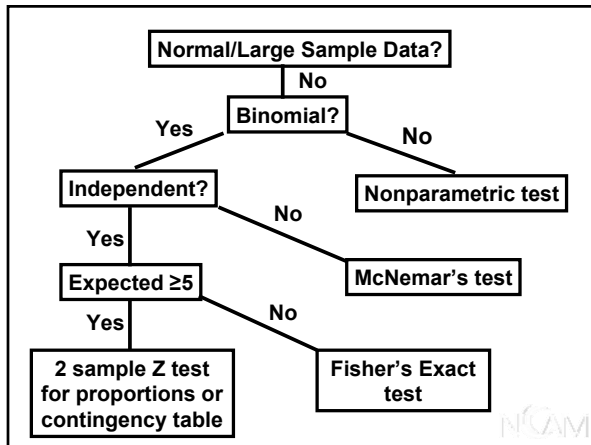

---

---

---

---

---
